2020 As people now go online from phones more than laptops most servers are in the cloud online advertising drives the Internet and social networks have taken over much human interaction many patterns of crime and abuse are the same but the methods have evolved Ross Anderson explores what security engineering means in 2020 including How the basic elements of cryptography protocols and access control translate to the new world of phones cloud services social media and the Internet of Things Who the attackers are from nation states and business competitors through criminal gangs to stalkers and playground bullies What they do from phishing and carding through SIM swapping and software exploits to DDoS and fake news Security psychology from privacy through ease of use to deception The economics of security and dependability why companies build vulnerable systems and governments look the other way How dozens of industries went online well or badly How to manage security and safety engineering in a world of agile development from reliability engineering to DevSecOps The third edition of Security Engineering ends with a grand challenge sustainable security As we build ever more software and connectivity into safety critical durable goods like cars and medical devices how do we design systems we can maintain and defend for decades Or will everything in the world need monthly software upgrades and become unsafe once they stop

Designing Secure Systems Michael Melone, 2021-09-27 Modern systems are an intertwined mesh of human process physical security and technology Attackers are aware of this commonly leveraging a weakness in one form of security to gain control over an otherwise protected operation To expose these weaknesses we need a single unified model that can be used to describe all aspects of the system on equal terms Designing Secure Systems takes a theory based approach to concepts underlying all forms of systems from padlocks to phishing to enterprise software architecture We discuss how weakness in one part of a system creates vulnerability in another all the while applying standards and frameworks used in the cybersecurity world Our goal to analyze the security of the entire system including people processes and technology using a single model We begin by describing the core concepts of access authorization authentication and exploitation We then break authorization down into five interrelated components and describe how these aspects apply to physical human process and cybersecurity Lastly we discuss how to operate a secure system based on the NIST Cybersecurity Framework CSF concepts of identify protect detect respond and recover Other topics covered in this book include the NIST National Vulnerability Database NVD MITRE Common Vulnerability Scoring System CVSS Microsoft's Security Development Lifecycle SDL and the MITRE ATT&CK Framework
