## **Nitric Oxide In Health And Disease Biomedical Research Topics:**

**Nitric Oxide in Health and Disease** Jill Lincoln, Charles H. V. Hoyle, Geoffrey Burnstock, 1997-08-28 Nitric oxide has a tantalizing role in health and disease while many of its wide ranging effects are well known there remains much more to explore and to learn about the interactions of this fascinating molecule in physiological and pathophysiological processes The volume reviews the myriad effects of nitric oxide as a chemical messenger in the central nervous system peripheral nervous system immune system and cardiovascular system Furthermore it provides a very practical introduction to the procedures and experimental protocols necessary to work with and study nitric oxide and its synthesizing enzyme nitric oxide synthase in the laboratory In this respect the volume is unique providing as it does a complete single volume review of the role of nitric oxide in health and disease and a very practical introduction to the methods and protocols involved in this intriguing and active area of biomedical research

*Fish Physiology: The Multifunctional Gut of Fish*, 2010-10-21 The Multifunctional Gut of Fish provides a comprehensive synthesis and an integrative overview of the range of gut functions and their implications for organismal physiology The highly diversified anatomy and functions of the gut including nutrient uptake immune barrier function salt and water homeostasis and respiration as well as neuroendocrine actions and control are covered in detail by leading authors In addition this volume explores the pronounced implications of gut function for whole animal integrative physiology and compensatory demands for non gastrointestinal organs As the first comprehensive reference to discuss the diverse morphological and functional adaptations of the gut this volume provides an excellent resource for comparative physiologists aquaculturists and biomedical researchers employing fish as model organisms for mammalian physiology Includes chapters dedicated to anatomical and functional features of the gastro intestinal tract of fish as well as integrative aspects of gut organ function Includes in depth coverage of recently recognized implications of feeding on salt homeostasis and acid base balance Provides syntheses of implications of gut function for homeostasis Essential text for those interested in the wide diversity of functions performed by the gut

Mitochondrial Disorders in Neurology 2 Anthony Henry Vernon Schapira, Salvatore DiMauro, 2002 Gain practical explanations of the science underlying mitochondrial disorders in neurology Written by leading experts this new Blue Book helps you recognize and manage the diseases Includes Sections on the role of mitochondria in neurodegenerative disease The development of animal models for mitochondrial diseases The design of treatments for patients with mitochondrial defects

**Reviews in Cardiovascular Pharmacology: 2023** Yusof Kamisah, Mas Rizky A. A. Syamsunarno, Ismail Laher, 2025-02-27 Cardiovascular diseases are a principal cause of death globally Cardiovascular diseases include

hypertension atherosclerosis ischemic heart disease and heart failure which cause a hike in socioeconomic burden The disorders can occur due to unhealthy lifestyle like smoking and high fat diet genetic and age Both experimental and clinical studies are in progress in search for drugs with improved efficacy and lesser side effects These studies and experimental research aim to develop novel cardiovascular drugs many of which are used clinically to alleviate the symptoms and severity of the diseases For instance combined therapy of sacubitril valsartan for patients with heart failure demonstrates better clinical outcomes than the use of valsartan alone Moreover recently clinical indications of originally non cardiovascular drugs such as sodium glucose co transporter 2 inhibitors antidiabetic drugs are repurposed for the treatment of cardiovascular diseases Therefore it is ultimately eminent for the research community to be updated with recent advances in cardiovascular pharmacotherapy Reviews in Cardiovascular Pharmacology 2023 will publish high quality scholarly review papers on key topics in Cardiovascular Pharmacology It aims to highlight recent progress in the field whilst emphasizing important directions and new possibilities for future inquiries We anticipate the research presented will promote discussion in the Cardiovascular Pharmacology community that will translate to best practice applications in clinical public health and policy settings *Glial Cells: Managers of Neuro-immunity* Carlos Barcia, Gilles J. Guillemin, James F. Curtin, Jeffrey M.

Zirger, 2016-05-30 Immune responses within the brain are still scarcely explored Nerve tissue damage is accompanied by the activation of glial cells primarily microglia and astroglia and such activation is responsible for the release of cytokines and chemokines that maintain the local inflammatory response and actively recruit lymphocytes and monocytes to the damaged areas Theoretically these responses are designed to repair the brain damage However alterations or a chronic perpetuation of these responses may underlie a number of neuro pathologies It is thought that each inflammatory scenario within the brain have a specific biochemical footprint characterized by the release of determined cytokines chemokines and growing factors able to define particular immunological responses Alongside glial cells transform their cell body become larger and develop higher number of branches adopting an active morphological phenotype These changes are related with the search of interactions with other cells such as bystander resident cells of the brain parenchyma but also cells homing from the blood stream In this process microglia and astrocytes communicates with other cells by the formation of specific intercellular connections that are still poorly understood These interactions are complex and entail the arrangement of cytoskeletal compounds secretory and phagocytic domains In this particular crosstalk there is a two way communication in which glial cells and target cells come together establishing interfaces with specific information exchange This way glial cells orchestrate the particular response recruiting cellular subsets within the central nervous system and organizing the resolution of the brain damage In this Frontiers Research Topic we compile a selection of articles unfolding diverse aspects of glial derived inflammation focused on neurodegenerative diseases and other nervous system disorders with special emphasis on microglia macrophages as leading actors managing neuro immunity **Post-Exercise Recovery:**

**Fundamental and Interventional Physiology** Sergej M. Ostojic, 2016-05-25 Physiological responses after maximal and submaximal exercise are routinely monitored in a plethora of diseases e.g. cardiovascular diseases, cancer, diabetes, asthma, neuromuscular disorders and normal populations e.g. athletes, youth, elderly, while slower or irregular post-exercise recovery usually indicates poor health and/or low fitness level. Abnormal post-exercise recovery as assessed via blunted post-exercise heart rate dynamics helps to predict the presence and severity of coronary artery disease, while differences in recovery outcomes in athletes might discriminate between fit and unfit individuals. Disturbances in post-exercise recovery might be due to acute or persistent changes in 1) adaptive responses mediated by the autonomic nervous system and vasodilator substances, 2) cellular bioenergetics and/or 3) muscular plasticity. Preliminary evidence suggests a possible role of time-dependent modulation of nitric oxide synthase and adenosine receptors during post-exercise recovery, yet no molecular attributes of post-exercise recovery are revealed so far. Currently, several markers of post-exercise recovery are used, e.g. heart rate measures, hormone profiles, biochemical and hematological indices; however, none of them meets all criteria to make its use generally accepted as the gold standard. In addition, recent studies suggest that different pharmacological agents and dietary interventions or manipulative actions, e.g. massage, cold water immersion, compression garments, athletic training administered before, during or immediately after exercise, could positively affect post-exercise recovery. There is a growing interest to provide more evidence-based data concerning the effectiveness and safety of traditional and novel interventions to affect post-exercise recovery. The goals of this research topic are to critically evaluate the current advances on mechanisms and clinical implications of post-exercise recovery and to summarize recent experimental data from interventional studies. This knowledge may help to identify the hierarchy of key mechanisms and recognize methods to monitor and improve post-exercise recovery in both health and disease.

**Biomarkers in Allergic Eczema** Jan Geliebter, Junling Wang, Pranay Bharadwaj, Anish Raj Maskey, 2025-12-19 Eczema is a heterogeneous inflammatory skin disease that causes dry skin, scaly patches, blisters and inflammation. Allergic eczema is an itchy skin rash that develops when the skin comes in contact with an allergen. These reactions may occur immediately or there may be a delay. The best treatment for allergic eczema is avoidance; however, this is very difficult as the skin encounters many allergens on a regular basis. Allergic eczema poses a therapeutic challenge as different endotypes exist among patients.

and every patient does not respond equally to a particular treatment Development of allergic eczema biomarkers will allow better characterization and stratification of the patient and allow better comparison of current and new treatments Furthermore this will enhance personalized approach for characterization and treatment of different endotypes that exist in eczema Biomarkers are valuable tools as they provide information on the diseases endotypes identification of therapeutic targets monitoring of diseases progression and studies the effectiveness of a treatment The ultimate goal of this section is to identify clinically useful biomarkers that are cost efficient and involves non invasive methods These biomarkers can be a useful tool to predict allergic eczema progression and to better design treatment modalities for different groups of patients In this Research Topic we will be addressing these specific themes in order to further elucidate these concerns 1 Different endotypes in allergic eczema 2 Types of biomarkers for screening diagnostic and prognostic purposes 3 Current treatment of allergic eczema 4 Role of biomarkers in the characterization of allergic eczema patients 5 Immunological mechanisms associated with allergic eczema 6 Use of Biomarkers in diagnosis and monitoring the disease All article types accepted by Frontiers are encouraged
