Osteoporosis Third Edition:

An Atlas of Osteoporosis John C. Stevenson, Michael S. Marsh, 2007-12-10 The Third edition of this successful Atlas of Osteoporosis is designed to provide a wide range of physicians with a pictorial guide to this important disease. The illustrations are an excellent teaching resource and the text provides a concise overview to osteoporosis. For the first time text and illustrations are fully integrated. The book contains *Atlas of Postmenopausal Osteoporosis* Rene Rizzoli, 2011-10-25

Ren Rizzoli. Menopause is the time in a woman's life when reproductive capacity ends. Ovaries decrease their activity and the production of sex hormones ceases. This period may be associated with a large variety of symptoms affecting the cardiovascular and urogenital systems as well as skin, hair and bone. Bone capital is accumulated by the end of the second decade and remains more or less constant up to the time of menopause. Sex hormone deficiency leads to accelerated bone turnover, a negative balance and microarchitectural deterioration which compromises bone strength thereby increasing bone fragility and thus fracture risk. By the age of 80 it is estimated that 50% of trabecular bone will have been lost. Natural menopause occurs between the ages of 45 and 54 years all over the world. This age does not appear to have changed significantly over the centuries. In contrast since the middle of the 19th century life expectancy particularly in women has increased considerably with most women living to the age of 80 years or more in many regions of the world. This means that at the age of 50 years a woman will live for more than 30 years without bone protection by sex hormones. This represents more than one third of a woman's life. At the age of 50 years the lifetime risk to experience a fracture is about 50% ie one out of two women will have a fracture during this period.

Osteoporosis John S. Adams, Barbara P. Lukert, 1999-04-30 Modern society is altering the lifestyle and longevity of its members much more quickly than evolutionary adaptation to these changes can take place. The problem of calcium deficiency in the population is compounded by the growing percentage of aged individuals with relatively fragile, less massive skeletons. Current day civilizations are much more effective in prolonging human life in a state of relative debility than even a few decades ago. This reality is unlikely to change and mandates that we develop strategies to prevent aging related diseases like osteoporosis before they become manifest. Osteoporosis: Genetics, Prevention and Treatment places emphasis on the 1) genetic predisposition, 2) early recognition, and 3) prevention of osteoporosis. The intent is not to move the practitioner's attention away from intervention therapy of osteoporosis but rather to expand their view of this disease as one beginning at birth and one in which susceptibility is manifest at the conclusion of adolescence, not at menopause. The book concludes with an informed view of the future in terms of the recognition, prevention, and management of osteoporosis.
