

Intermittent Fasting

Stage 1: Right After Eating

- Carbohydrates from food are converted into glucose (sugar) and released into the bloodstream.
- Blood sugar level rises.
- Insulin stimulates the conversion of glucose into glycogen as energy storage.

Stage 2: 3 Hours After Eating

- While insulin works, blood sugar level drops.
- In a non-fasting state, glycogen is used as energy.
- Excess glycogen that is not used is stored in the body as fats.

Stage 3: 9 Hours After Eating

- As blood sugar levels continue to drop, the body reacts by converting glycogen back into glucose and releasing it into the bloodstream.
- Fat is not yet used as an energy source, as there is still glucose and glycogen available.

Stage 4: 11 Hours After Eating

- Now that the stored glycogen has been almost used up, a metabolic switch is flipped.
- Fat is burned as it is used as energy.

Stage 5: 14-16 Hours After Eating

- As fat-burning continues, fatty acids are converted into ketones via ketosis.
- Ketones provide energy to the brain, heart and other vital organs.
