Nikon VR system — Lending a steady hand for sharper images

But even by camera standards, a good shot isn't a lucky one. Nikon's VR (Vibration Reduction) system takes the shakiness out of your handheld photos so it's "less shaky" than when using lenses without VR. The results are crisp, sharp images under conditions that would normally require use of a tripod. Additionally, unlike in-camera vibration reduction systems, Nikon's VR in the lens is a tool that significantly improves handheld imaging.

Image is for illustrative purposes only.

To the moon and beyond

The precision reliability and ultra-precision of Nikon cameras and NIKKOR lenses earned them a place in Apple's famed Space Shuttle launch and Space Shuttle projects. To this day, Nikon continues to be the photographic instrument of choice for explorers both on earth, and in the vastness of outer space. Every NIKKOR embodies this tradition, delivering superior performance for photographers who demand only the best.

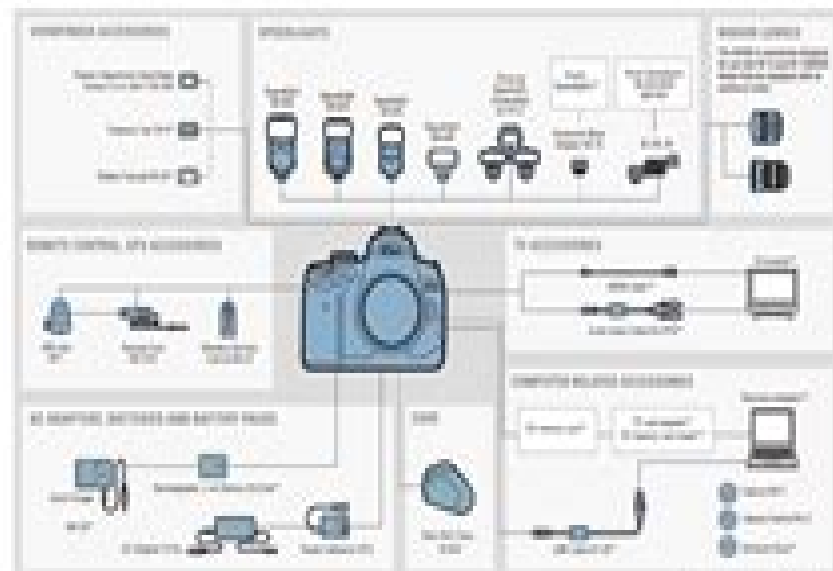

What does "IF" mean in lens descriptions?

The IF refers to the internal focusing of the lens. The aperture is an adjustable opening in the lens that determines how much light reaches the image sensor. It's made by 7 members. The larger the opening and longer the focal length.

What does "VR" mean in lens descriptions?

The VR refers to the built-in vibration reduction system. This built-in vibration reduction system is designed to compensate for hand shake. The larger the "VR" value, the greater the vibration reduction. Vibration reduction more than "VR" value will cause image blur. Hand shake is not visible.
