The subject of this book is the nested partitions method NP a relatively new optimization method that has been found to be very effective solving discrete optimization problems Such discrete problems are common in many practical applications and the NP method is thus useful in diverse application areas It can be applied to both operational and planning problems and has been demonstrated to effectively solve complex problems in both manufacturing and service industries To illustrate its broad applicability and effectiveness in this book we will show how the NP method has been successful in solving complex problems in planning and scheduling logistics and transportation supply chain design data mining and health care All of these diverse applications have one characteristic in common they all lead to complex large scale

discrete optimization problems that are intractable using traditional optimization methods 1.1 Large Scale Optimization

In developing the NP method we will consider optimization problems that can be stated mathematically in the following generic

form  $\min_{x \in X} f(x)$  where the solution space or feasible region  $X$  is either a discrete or bounded set of feasible solutions. We denote a solution to this problem  $x^*$  and the objective function value  $f(x^*)$ . **Optimization Theory and Methods** Wenyu Sun, Ya-Xiang Yuan, 2006-08-06 Optimization Theory and Methods can be used as a textbook for an optimization course for graduates and senior undergraduates. It is the result of the author's teaching and research over the past decade. It describes optimization theory and several powerful methods. For most methods, the book discusses an idea's motivation, studies the derivation, establishes the global and local convergence, describes algorithmic steps, and discusses the numerical performance.

**System Modelling and Optimization** M.J.D. Powell, S. Scholtes, 2013-03-20 System Modelling and Optimization covers research issues within systems theory, optimization, modelling, and computing. It includes contributions to structural mechanics, integer programming, nonlinear programming, interior point methods, dynamical systems, stability analysis, stochastic optimization, bilevel optimization, and semidefinite programming. Several survey papers written by leading experts in their fields complement new developments in theory and applications. This book contains most of the invited papers and a few carefully selected submitted papers that were presented at the 19th IFIP TC7 Conference on System Modelling and Optimization, which was held in Cambridge, England, from July 12 to 16, 1999, and sponsored by the International Federation for Information Processing (IFIP).

**Large-scale Optimization Methods** Nuri Denizcan Vanli, 2021 Large scale optimization problems appear quite frequently in data science and machine learning applications. In this thesis, we show the efficiency of coordinate descent (CD) and mirror descent (MD) methods in solving large scale optimization problems.

**Optimization Methods** Marco Cavazzuti, 2012-09-14 This book is about optimization techniques and is subdivided into two parts. In the first part, a wide overview on optimization theory is presented. Optimization is presented as being composed of five topics: namely, design of experiment, response surface modeling, deterministic optimization, stochastic optimization, and robust engineering design. Each chapter, after presenting the main techniques for each part, draws application-oriented conclusions, including didactic examples. In the second part, some applications are presented to guide the reader through the process of setting up a few optimization exercises, analyzing critically the choices which are made step by step, and showing how the different topics that constitute the optimization theory can be used jointly in an optimization process. The applications which are presented are mainly in the field of thermodynamics and fluid dynamics, due to the author's background.

**Topology Optimization** Martin Philip Bendsoe, O. L. E. Sigmund, 2014-01-15 **Separable Optimization** Stefan M. Stefanov, 2022-01-01

In this book, the theory, methods, and applications of separable optimization are considered. Some general results are presented. Techniques of approximating the separable problem by linear programming problem and dynamic programming are also studied. Convex separable programs subject to inequality/equality constraints and bounds on variables are also studied, and convergent iterative algorithms of polynomial complexity are proposed. As an application, these algorithms are

used in the implementation of stochastic quasigradient methods to some separable stochastic programs The problems of numerical approximation of tabulated functions and numerical solution of overdetermined systems of linear algebraic equations and some systems of nonlinear equations are solved by separable convex unconstrained minimization problems Some properties of the Knapsack polytope are also studied This second edition includes a substantial amount of new and revised content Three new chapters 15 17 are included Chapters 15 16 are devoted to the further analysis of the Knapsack problem Chapter 17 is focused on the analysis of a nonlinear transportation problem Three new Appendices E G are also added to this edition and present technical details that help round out the coverage Optimization problems and methods for solving the problems considered are interesting not only from the viewpoint of optimization theory optimization methods and their applications but also from the viewpoint of other fields of science especially the artificial intelligence and machine learning fields within computer science This book is intended for the researcher practitioner or engineer who is interested in the detailed treatment of separable programming and wants to take advantage of the latest theoretical and algorithmic results It may also be used as a textbook for a special topics course or as a supplementary textbook for graduate courses on nonlinear and convex optimization

#### **Introduction to Optimization Methods and their Application in Statistics B.**

Everitt, 2012-12-06 Optimization techniques are used to find the values of a set of parameters which maximize or minimize some objective function of interest Such methods have become of great importance in statistics for estimation model fitting etc This text attempts to give a brief introduction to optimization methods and their use in several important areas of statistics It does not pretend to provide either a complete treatment of optimization techniques or a comprehensive review of their application in statistics such a review would of course require a volume several orders of magnitude larger than this since almost every issue of every statistics journal contains one or other paper which involves the application of an optimization method It is hoped that the text will be useful to students on applied statistics courses and to researchers needing to use optimization techniques in a statistical context Lastly my thanks are due to Bertha Lakey for typing the manuscript

Practical Optimization Methods M. Asghar Bhatti, 2012-12-06 The goal of this book is to present basic optimization theory and modern computational algorithms in a concise manner The book is suitable for undergraduate and graduate students in all branches of engineering operations research and management information systems The book should also be useful for practitioners who are interested in learning optimization and using these techniques on their own Most available books in the field tend to be either too theoretical or present computational algorithms in a cookbook style An approach that falls some where in between these two extremes is adopted in this book Theory is presented in an informal style to make sense to most undergraduate and graduate students in engineering and business Computational algorithms are also developed in an informal style by appealing to readers intuition rather than mathematical rigor The available computationally oriented books generally present algorithms alone and expect readers to perform computations by hand or

implement these algorithms by themselves This obviously is unrealistic for a usual introductory optimization course in which a wide variety of optimization algorithms are discussed There are some books that present programs written in traditional computer languages such as Basic FORTRAN or Pascal These programs help with computations but are of limited value in developing understanding of the algorithms because very little information about the intermediate steps v Preface VI is presented

**Optimization Methods in Machine Learning: Theory and Applications** Ankan Saha, University of Chicago, 2013 We look at the integral role played by convex optimization in various machine learning problems Over the last few years there has been a lot of machine learning problems which have a non smooth convex optimization at its core These problems generally call for fast first order iterative methods as obtaining the exact minimum is often impossible and second order methods or higher become prohibitively expensive even on moderately sized datasets We look at a few such optimization problems that arise in different contexts and show that a class of smoothing strategies due to

Nesterov can be applied to these seemingly very different problems to obtain theoretically faster rates of convergence than existing methods Our experimental results validate the speed and efficacy of our methods and scale significantly well over a broad range of datasets This thesis also explores an often used but understudied optimization algorithm namely the cyclic coordinate descent method and provides a novel theoretical analysis of the first non asymptotic convergence rates of cyclic coordinate descent under certain assumptions This work also sheds light on some of the recent advances in online convex optimization to minimize regret in the presence of smooth unknown functions We also look at online learning from the point of view of stability and provide a new integral framework which encompasses the regret analysis of all existing algorithms as specific cases of this framework We investigate related methods of analysis and the central role played by optimization in all these seemingly different but connected domains of machine learning research
