Animal Cell Culture Mohamed Al-Rubeai, 2014-11-28 Animal cells are the preferred cell factories for the production of complex molecules and antibodies for use as prophylactics therapeutics or diagnostics Animal cells are required for the correct post translational processing including glycosylation of biopharmaceutical protein products They are used for the production of viral vectors for gene therapy Major targets for this therapy include cancer HIV arthritis cardiovascular and CNS diseases and cystic fibrosis Animal cells are used as in vitro substrates in pharmacological and toxicological studies This book is designed to serve as a comprehensive review of animal cell culture covering the current status of both research and applications For the student or R D scientist or new researcher the protocols are central to the performance of cell culture work yet a broad understanding

is essential for translation of laboratory findings into the industrial production. Within the broad scope of the book each topic is reviewed authoritatively by experts in the field to produce state of the art collection of current research. A major reference volume on cell culture research and how it impacts on production of biopharmaceutical proteins worldwide the book is essential reading for everyone working in cell culture and is a recommended volume for all biotechnology libraries.

Cultured Meat - Are We Getting it Right? Johannes le Coutre, Dietrich Knorr, 2021-08-17 **Biosimilars and Interchangeable Biologics** Sarfaraz K. Niazi, 2016-01-05

What's the Deal with Biosimilars? Biosimilars are gaining momentum as new protein therapeutic candidates that can help fill a vital need in the healthcare industry. The biological drugs are produced by recombinant DNA technology that allows for large scale production and an overall reduction in time in costs and development. Part of a two volume set that covers varying aspects of biosimilars. **Biosimilars and Interchangeable Biologics: Tactical Elements** explores the development and manufacturing of biosimilars and targets challenges surrounding the creation of these products. This includes manufacturing production costs and intellectual property barriers particularly in regulated markets. Regulatory agencies are still in the process of developing guidelines. It addresses the complexity of biological drugs and it discusses specific structural elements vital to the functionality, immunogenicity and safety of biosimilar products. Of specific interest to practitioners, researchers and scientists in the biopharmaceutical industry, this volume provides an overall understanding of the hurdles, difficulties and practicalities of developing a strong plan. It introduces a step by step approach for creating a strategy that helps develop and manufacture a biosimilar product while reducing overall production costs and meeting the requirements of biosimilarity based on analytical and functional pharmacokinetic, pharmacodynamic, where applicable, and nonclinical toxicology or toxicokinetic similarity where appropriate while remaining competitive in the market.

Bioreactors Goutam Saha, Alok Barua, Satyabroto Sinha, 2017-12-01

Bioreactors: Animal Cell Culture Control for Bioprocess Engineering presents the design, fabrication and control of a new type of bioreactor meant especially for animal cell line culture. The new bioreactor called the see saw bioreactor is ideal for the growth of cells with a sensitive membrane. The see saw bioreactor derives its name from its principle of operation in which liquid columns in either limb of the reactor alternately go up and down. The working volume of the reactor is small to within 15 L. However, it can easily be scaled up for large production in volume of cell mass in the drug and pharmaceutical industries. The authors describe the principle of operation of the see saw bioreactor and how to automatically control the bioprocess. They discuss different control strategies as well as the thorough experimental research they conducted on this prototype bioreactor in which they applied a time delay control for yield maximization. To give you a complete understanding of the design and development of the see saw bioreactor, the authors cover the mathematical model they use to describe the kinetics of fermentation, the genetic algorithms used for deriving the optimal time trajectories of the bioprocess variables and the corresponding control inputs for maximizing the product yield. One chapter is devoted to the application of time delay

control Following a description of the bioreactor s working setup in the laboratory the authors sum up their investigation and define the future scope of work in terms of design control and software sensors
