Person Administering Scale _____

Administer stroke scale items in the order listed. Record performance in each category after each subscale exam. Do not go back and change scores. Follow directions provided for each exam technique. Scores should reflect what the patient does, not what the clinician thinks the patient can do. The clinician should record answers while administering the exam and work quickly. Except where indicated, the patient should not be coached (i.e., repeated requests to patient to make a special effort).

Instructions	Scale Definition	Score
1a. Level of Consciousness: The investigator must choose a response if a full evaluation is prevented by such obstacles as an endotracheal tube, language barrier, orotracheal trauma/bandages. A 3 is scored only if the patient makes no movement (other than reflexive posturing) in response to noxious stimulation.	0 = Alert; keenly responsive. 1 = Not alert; but arousable by minor stimulation to obey, answer, or respond. 2 = Not alert; requires repeated stimulation to attend, or is obtunded and requires strong or painful stimulation to make movements (not stereotyped). 3 = Responds only with reflex motor or autonomic effects or totally unresponsive, flaccid, and areflexic.	_____
1b. LOC Questions: The patient is asked the month and his/her age. The answer must be correct - there is no partial credit for being close. Aphasic and stuporous patients who do not comprehend the questions will score 2. Patients unable to speak because of endotracheal intubation, orotracheal trauma, severe dysarthria from any cause, language barrier, or any other problem not secondary to aphasia are given a 1. It is important that only the initial answer be graded and that the examiner not "help" the patient with verbal or non-verbal cues.	0 = Answers both questions correctly. 1 = Answers one question correctly. 2 = Answers neither question correctly.	_____
1c. LOC Commands: The patient is asked to open and close the eyes and then to grip and release the non-paretic hand. Substitute another one step command if the hands cannot be used. Credit is given if an unequivocal attempt is made but not completed due to weakness. If the patient does not respond to command, the task should be demonstrated to him or her (pantomime), and the result scored (i.e., follows none, one or two commands). Patients with trauma, amputation, or other physical impediments should be given suitable one-step commands. Only the first attempt is scored.	0 = Performs both tasks correctly. 1 = Performs one task correctly. 2 = Performs neither task correctly.	_____
2. Best Gaze: Only horizontal eye movements will be tested. Voluntary or reflexive (oculocephalic) eye movements will be scored, but caloric testing is not done. If the patient has a conjugate deviation of the eyes that can be overcome by voluntary or reflexive activity, the score will be 1. If a patient has an isolated peripheral nerve palsy (CN III, IV or VI), score a 1. Gaze is testable in all aphasic patients. Patients with ocular trauma, bandages, pre-existing blindness, or other disorder of visual acuity or fields should be tested with reflexive movements, and a choice made by the investigator. Establishing eye contact and then moving about the patient from side to side will occasionally clarify the presence of a partial gaze palsy.	0 = Normal. 1 = Partial gaze palsy; gaze is abnormal in one or both eyes, but forced deviation or total gaze paresis is not present. 2 = Forced deviation, or total gaze paresis not overcome by the oculocephalic maneuver.	_____

Reframed Stuart Shanker, 2020-03-23 For Stuart Shanker the possibility of a truly just and free society begins with how we see and nurture our children Shanker is renowned for using cutting edge neuroscience to help children feel happy and think clearly by better regulating themselves In his new book Reframed Shanker explores self regulation in wider social terms Whereas his two previous books Calm Alert and Learning and Self Reg were written for educators and parents Reframed the final book in the trilogy unpacks the unique science and conceptual practices that are the very lifeblood of Self Reg making it an accessible read for new Self Reggers Reframed is grounded in the three basic principles of Shanker Self Reg There is no such thing as a bad lazy or stupid kid All people can learn to self regulate in ways that promote rather than constrict growth There is no such thing as a fixed outcome trajectories can always be changed at any point in the lifespan if only we have the right knowledge and tools Only a society that embraces these principles and strives to practice them argues Shanker can become a truly just society The paradigm revolution presented in Reframed not only helps us understand the harrowing time we are living through but inspires a profound sense of hope for the future Shanker shows us how to build a compassionate society one mind at a time

FINDING THE BEST APPROACH TO ANALYZE THE NIHSS AT 24 HOURS TO MEASURE TREATMENT EFFECT IN TRIALS OF ACUTE STROKE Nadinda van Ende, 2017 Background NIH stroke scale NIHSS is increasingly used as outcome in RCTs of acute stroke treatment but no consensus exists on how to analyze the effect of treatment on NIHSS Our aim is to study what the best approach is to analyze this important early indicator of treatment effect Methods We used the data from the MR CLEAN trial n 500 in a bootstrap analysis with 5000 runs to estimate valid and generalizable treatment effect parameters based on NIHSS Missing values for pertinent outcome and baseline variables were imputed with single regression if less than 4% NIHSS was analyzed with 5 different approaches identified in the literature For the approaches that used regression models unadjusted and adjusted estimates for age baseline NIHSS and collateral score were calculated We added the effect on mRS for comparison We compared the effect estimates between the different approaches and the Z statistic as a measure that combines strength of the effect and precision Results Baseline characteristics were evenly distributed between intervention and control NIHSS scores at 24 h and 1 week were available with less than 1% and 4% missing values The absolute z value of the regression model of the effect of EVT on mRS at 3 months was 3.12 and 3.15 after adjustment Z values or any type of effect analysis of NIHSS at 1 week were not better than those at 24 hours data on poster figure Z values for plain NIHSS and change in NIHSS from baseline were substantially lower than the reference value Z values for dichotomized NIHSS exceeded the reference only for two of the three dichotomizations The z value of the effect parameter u_{201c} improvement u_{201d} exceeded the reference but only barely so for fair improvement The effect parameter difference in log NIHSS at 24h exceeded the reference Discussion Using plain NIHSS or change in NIHSS in a linear regression model to estimate the effect of acute stroke treatment is not an efficient

and sensitive approach Dichotomizing the NIHSS in good outcome or improvement seems efficient but the best cut point will vary unpredictably depending on the patient population and chance We conclude that analysis of the effect of treatment on the full NIHSS scale with linear regression on log transformed data provides an efficient way to analyze early treatment effects with the NIH stroke scale **NIH Stroke Scale** National Institute of Neurological Disorders and Stroke (U.S.),2011*
