Parameterized Complexity Theory

Parameterized Complexity Theory J. Flum, M. Grohe, 2006-05-01 Parameterized complexity theory is a recent branch of computational complexity theory that provides a framework for a refined analysis of hard algorithmic problems. The central notion of the theory, fixed parameter tractability, has led to the development of various new algorithmic techniques and a whole new theory of intractability. This book is a state of the art introduction to both algorithmic techniques for fixed parameter tractability and the structural theory of parameterized complexity classes, and it presents detailed proofs of recent advanced results that have not appeared in book form before. Several chapters are each devoted to intractability algorithmic techniques for designing fixed parameter tractable algorithms and bounded fixed parameter tractability and subexponential time complexity. The treatment is comprehensive and the reader is supported with exercises, notes, a detailed index, and some background on complexity theory and logic. The book will be of interest to computer scientists, mathematicians, and graduate students engaged with algorithms and problem complexity. *Parameterized Complexity in the Polynomial Hierarchy* Ronald de Haan, 2019-12-30 Parameterized Complexity in the Polynomial Hierarchy was co-recipient of the E. W. Beth Dissertation Prize 2017 for outstanding dissertations in the fields of logic, language, and information. This work extends the theory of parameterized complexity to higher levels of the Polynomial Hierarchy (PH). For problems at higher levels of the PH, a promising solving approach is to develop fixed parameter tractable reductions to SAT and to subsequently use a SAT solving algorithm to solve the problem. In this dissertation, a theoretical toolbox is developed that can be used to classify in which cases this is possible. The use of this toolbox is illustrated by applying it to analyze a wide range of problems from various areas of computer science and artificial intelligence. Parameterized Complexity Rodney G. Downey, M.R. Fellows, 2012-12-06 The idea for this book was conceived over the second bottle of Villa Maria's Cabernet Medot 89 at the dinner of the Australasian Combinatorics Conference held at Palmerston North, New Zealand, in December 1990, where the authors first met and discovered they had a number of interests in common. Initially, we embarked on a small project to try to formulate reductions to address the apparent parameterized intractability of DOMINATING SET and to introduce a structure in which to frame our answers. Having spent several months trying to get the definitions for the reductions right, they now seem so obvious we turned to our tattered copies of Garey and Johnson's work [239]. We were stunned to find that virtually none of the classical reductions worked in the parameterized setting. We then wondered if we'd be able to find any interesting reductions. Several years, many more bottles, so many papers and reductions later, it seemed that we had unwittingly stumbled upon what we believe is a truly central and new area of complexity theory. It seemed to us that the material would be of great interest to people working in areas where exact algorithms for a small range of parameters are natural and useful, e.g., Molecular Biology, VLSI design. The tractability theory was rich with distinctive and powerful techniques. The intractability theory seemed to have a deep structure and techniques all of its own. *Invitation to*

Parameterized Complexity Applied in Algorithmic Game Theory Mahdi Parsa, 2011 Abstract The modern mathematical treatment of the study of decisions taken by participants whose interests are in conflict is now generally labeled as 2game theory3 To understand these interactions the theory provides some solution concepts An important such a concept is the notion of Nash equilibrium which provides a way of predicting the behavior of strategic participants in situations of conflicts However many decision problems regarding to the computation of Nash equilibrium are computationally hard Motivated by these hardness results we study the parameterized complexity of the Nash equilibrium In parameterized complexity one considers computational problems in a twodimensional setting the first dimension is the usual input size n the second dimension is a positive integer k the parameter A problem is fixed parameter tractable FPT if it can be solved in time $f(k)n^{O(1)}$ where f denotes a computable possibly exponential function We show that some decision problems regarding to the computation of Nash equilibrium are hard even in parameterized complexity theory However we provide FPT algorithms for some other problems relevant to the computation of Nash equilibrium
