[A Guide to Claims-Based Identity and Access Control, Version 2](#) Dominick Baier,Vittorio Bertocci,Keith Brown,Scott Densmore,Eugenio Pace,Matias Woloski,2013-03-18 As an application designer or developer imagine a world where you don t have to worry about authentication Imagine instead that all requests to your application already include the information you need to make access control decisions and to personalize the application for the user In

this world your applications can trust another system component to securely provide user information such as the user's name or e-mail address a manager's e-mail address or even a purchasing authorization limit. The user's information always arrives in the same simple format regardless of the authentication mechanism whether it's Microsoft Windows integrated authentication forms based authentication in a Web browser an X.509 client certificate Windows Azure Access Control Service or something more exotic. Even if someone in charge of your company's security policy changes how users authenticate you still get the information and it's always in the same format. This is the utopia of claims based identity that *A Guide to Claims Based Identity and Access Control* describes. As you'll see claims provide an innovative approach for building applications that authenticate and authorize users. This book gives you enough information to evaluate claims based identity as a possible option when you're planning a new application or making changes to an existing one. It is intended for any architect developer or information technology IT professional who designs, builds or operates web applications, web services or SharePoint applications that require identity information about their users.
