Target Review Clearance:

Reviews on Biomarker Studies in Psychiatric and Neurodegenerative Disorders Paul C. Guest, 2019-02-12 This book includes a series of reviews on general aspects of biomarker use in the study of psychiatric and neurodegenerative diseases and the development of medications involved in their treatment. It describes the pros and cons of the various approaches and covers the successes and failures in this research field. It is only by a thorough understanding of the shortcomings that progress can be made. The overall goal is to facilitate the understanding and treatment of these disorders by providing a viable mechanism of catching up with other areas of modern medicine such as diabetes and heart disease. Finally, it is anticipated that the development and application of valid biomarker tests and the leveraging of novel drug targets will help the fields of psychiatry and neurodegenerative disorders move into the area of personalized medicine where the right patients can receive the right medication at the right time for the best possible outcome.

Neuroinflammation as a Target for Intervention in Subarachnoid Hemorrhage Fernando Testai, J. Marc Simard, 2020-01-10 Aneurysmal subarachnoid hemorrhage (SAH) is a stroke subtype that affects preponderantly young adults. This condition carries a mortality of approximately 30–50% and a rate of permanent neurological disability of 30%. In addition, a substantial number of patients with an apparent good outcome suffer from residual neurocognitive impairment which, though subtle, prevents them from returning to work and having a normal life. Based on these data, it has been estimated that SAH is responsible for almost a quarter of all the years lost because of stroke. The calcium channel blocker nimodipine remains the only pharmacological treatment for SAH. This drug, however, has limited effectiveness and its use in clinical practice may be limited due to hypotension. Therefore, novel and effective treatments for this condition are desperately needed. The outcome in SAH has been associated with early brain injury, vasospasm, and delayed cerebral ischemia. Mechanistically, these processes are characterized by micro and macro vascular dysfunction, microthrombi formation, blood-brain barrier (BBB) dysregulation, brain edema, and neural cell survival. Soon after SAH, there is a robust inflammatory response characterized by pyrexia, leukocytosis, and upregulation of adhesion molecules and cytokines in the periphery and in the CNS. Observational studies have shown that patients with more severe inflammatory responses experience worse outcomes after SAH. At the molecular level, different proinflammatory intracellular signaling pathways, including mitogen-activated protein kinase and nuclear factor kappa B, are activated in cerebral vessels after experimental SAH, and their inhibition has been shown to decrease the occurrence of vasospasm. In addition, clinical and preclinical data have linked cytokine upregulation (interleukins IL-1B, IL-6, and IL-8, tumor necrosis factor, and monocyte chemoattractant protein 1), enhanced expression of adhesion molecules (selectins, integrins, and ICAM), and neutrophil activation to vasospasm of large cerebral arteries. Microvascular dysregulation and cell death, immune cells regulate hemostasis and secrete active proteases including matrix metalloproteinase 9, which promote microthrombosis and induce blood-brain barrier dysfunction.

respectively In this context it has been suggested that an enhanced inflammatory burden might contribute to brain injury in SAH through numerous downstream mechanisms On the other hand growing evidence demonstrates that neuroinflammation may influence the proliferation and migration of progenitor cells that participate of synaptic plasticity neurogenesis and neurorepair
