prediction and no forecast is complete without a description of its uncertainty Effective communication of uncertainty helps people better understand the likelihood of a particular event and improves their ability to make decisions based on the forecast Nonetheless for decades users of these forecasts have been conditioned to receive incomplete information about uncertainty They have become used to single valued deterministic forecasts e g the high temperature will be 70 degrees Farenheit 9 days from now and applied their own experience in determining how much confidence to place in the forecast Most forecast products from the public and private sectors including those from the National Oceanographic and Atmospheric Administration s National Weather Service continue this deterministic legacy Fortunately the National Weather Service and others in the prediction community have recognized the need to view uncertainty as a fundamental part of forecasts By partnering with other segments of the community to understand user needs generate relevant and rich informational products and utilize effective communication vehicles the National Weather Service can take a leading role in the transition to widespread effective incorporation of uncertainty information into predictions Completing the Forecast makes recommendations to the National Weather Service and the broader prediction community on how to make this transition

Transistor Level Modeling for Analog/RF IC Design Wladyslaw Grabinski,Bart Nauwelaers,Dominique Schreurs,2006-07-01 Among many great inventions made in the 20th century electronic circuits which later evolved into integrated circuits are probably the biggest when considering their contribution to human society Entering the 21st century the importance of integrated circuits has increased even more In fact without the help of integrated circuits recent high technology society with the internet cellular phone car navigation digital camera and robot would never have been realized Nowadays integrated circuits are indispensable for almost every activity of our society One of the critical issues for the fabrication of integrated circuits has been the precise design of the high speed or high frequency operation of circuits with huge number of components It is quite natural to predict the circuit operation by computer calculation and there have been three waves for this at 15 year intervals The rst wave came at the beginning of the 1970s when LSIs Large Scale Integrated circuits with more than 1000 components had just been introduced into the market A mainframe computer was used for the simulation and each semiconductor company used its own proprietary simulators and device models However the capability of the computer and accuracy of the model were far from satisfactory and there are many cases of the necessity of circuit re design after evaluation of the rst chip The second wave hit us in the middle of 1980s when the EWS Engine ing Work Station was introduced for use by designers Proceedings ,2003 **Proceedings of the National Electronics Conference** ,1967 **Computer-aided Integrated Circuit Design** Gerald J.
