[The State of Integrated Computer-Aided Manufacturing/Computer Numerical Control: Prior Development and the Path Toward a Smarter Computer Numerical Controller](#) Roby Lynn, Moneer Helu, Mukul Sati, Tommy Tucker, Thomas Kurfess, 2020 Current industrial practice in automated manufacturing operations relies on low fidelity data transmission methods between computer numerical control CNC machine tools and the computer aided manufacturing CAM systems used to program them The typical language used to program CNC machines known as G Code has been in existence for nearly sixty years and offers limited resolution for command data In addition the proprietary nature of industrial CNC systems hampers the ability of manufacturers to expand and improve upon the capability of existing machine tools G Code was not designed to support transmission of feedback data and thus both the CAM system and higher level organizational control systems are frequently blind to the state of the production process In response separate standards that enable data exchange with machine tools have been used by industry such as MTConnect and Open Platform Communications Unified Architecture However these standards enable data pathways that are independent of the G Code command data pathway and thus they

provide practically no means to affect the state of a process on receipt of feedback data As a result control and data acquisition exist in separate realms which makes the implementation of self optimizing smart CNC systems challenging This state of the art review surveys existing methods for data transmission to and from machine tools and explores the current state of so called integrated CAM CNC systems that enable more thorough control of the machining process using intelligence built into the CAM system The literature survey reveals that integrated CAM CNC systems are impeded both by the data exchange methods used to interface with CNC systems in addition to the proprietary and closed architecture of the CNC systems themselves Future directions in integrated CAM CNC research are identified based on the requirements identified for such systems
