and how to develop with it Author John Ciliberti guides you through the framework and development tools presenting typical challenges along with code solutions and clear concise explanations to accelerate application development Inside you will find recipes dealing with streamlined syntax full control over HTML a simple API for creating RESTful web services writing support for test driven development and more Solve problems immediately by pasting in code from the recipes or put multiple recipe solutions together to overcome challenging development obstacles Dive head first into ASP NET MVC web development with ASP NET MVC 4 Recipes

Application of the Stochastic Optimization Method in Optimizing Traffic Signal Control Settings Byungkyu Park,2008 Traffic congestion has greatly affected not only the nation s economy and environment but also every citizen s quality of life A recent study shows that every American traveler spent an extra 38 hours and 26 gallons of fuel per year due to traffic congestion during the peak period Of this congestion 10% is attributable to improper operations of traffic signals Surprisingly more than a half of all signalized intersections in the United States needs to be re optimized immediately to maintain peak efficiency Even though many traffic signal control systems have been upgraded from pre timed controllers to actuated and adaptive controllers the traffic signal optimization software has not been kept current For example existing commercial traffic signal timing optimization programs including SYNCHRO and TRANSYT 7F do not optimize advanced controller settings available in the modern traffic controllers including minimum green time extension time and detector settings This is in part because existing programs are based on macroscopic simulation tools that do not explicitly consider individual vehicular movements To overcome such a shortcoming a stochastic optimization method SOM was proposed and successfully applied to a signalized corridor in Northern Virginia This study presents enhancements made in the SOM and case study results from an arterial network consisting of 16 signalized intersections The proposed method employs a distributed computing environment DCE for faster computation time and uses a shuffled frog leaping algorithm SFLA for better optimization The case study results showed that the proposed enhanced SOM method called SFLASOM improved the total network travel times over field settings by 3 5% for Mid Day and 2 1% for PM Peak In addition corridor travel times were improved by 2 3% to 17 9% over field settings However when the new SOM timing plan was compared to the new field timing plan implemented in July 2008 the improvements were marginal showing slightly over 2% reductions in individual vehicular delay
