White, Stephen A. Velinsky, 2004 The Advanced Highway Maintenance and Construction Technology AHMCT Research Center has been developing robotic equipment and machinery for highway maintenance and construction operations It is a cooperative venture between the University of California at Davis and the California Department of Transportation Caltrans The research and development projects have the goal of increasing safety and efficiency of roadwork operations through the appropriate application of automation solutions This report describes the continuing development of automated equipment for deploying and retrieving traffic cones In this latest phase of the project the center has continued the development of the automated cone machine ACM through further testing and development of the first generation integrated prototype ACM and the design and fabrication of an integrated Multi stack ACM developed to maximize the number of cones carried by the automated cone machine Included in this report is the development of an improved control system for the retrieval arm which is a critical component used to pick up the traffic cone off the road A first generation ACM prototype ACM 1 is being used in tests and demonstrations on the highways of California Operators using ACM 1 can place and retrieve cones without any set up and control the machine from within the confines of the cab These machines can easily be run by a single operator and are very compatible with the process of closing a lane The ACM 1 design was integrated into the existing Caltrans manual cone body truck and was limited to two stacks of 40 cones each The new ACM multistack is designed to carry six stacks of 50 cones for a total of 300 cones These machines are unambiguous demonstrations of the successful application of automation in a very demanding environment This development work and the continued support of commercialization at AHMCT support the Caltrans goal of making these machines available to the maintenance operations **Handbook of Thermoprocessing Technologies** Axel von Starck, Alfred Mühlbauer, Carl Kramer, 2005 In Europe thermoprocessing is the third largest energy consumption sector following traffic and room heating Its structure is very much diversified and complex Therefore it is split into a large number of subdivisions each of them having a high importance for the industrial economy Accordingly we find the application know

how for the design and the execution of respective equipment represented by a multitude of small but very specialized and significant companies and their experts As a result there was only little chance to find a comprehensive survey of the practical side of this technology so far This gap is now filled by the new Handbook of Thermoprocessing Technologies based on the contributions of many highly experienced outstanding engineers working in this field The main intention of this book is the presentation of practical thermal processing for the improvement of material and parts in industrial application Additionally a summary of respective thermal and material science fundamentals is given as well as basic fuel related and electrical engineering knowledge for this technology and finally design aspects components and safety requirements for the necessary heating installations are covered In conclusion a very wide and competent state of the art description is now available for all manufacturers and users of thermoprocessing equipment But also specialists from neighbouring fields students and all those who are generally interested in this important but widely unknown technology will find a quick survey here as well as a very profound expertise
