Using OpenMP-The Next Step Ruud Van Der Pas, Eric Stotzer, Christian Terboven, 2017-10-20 A guide to the most recent advanced features of the widely used OpenMP parallel programming model with coverage of major features in OpenMP 4.5 This book offers an up-to-date practical tutorial on advanced features in the widely used OpenMP parallel programming model Building on the previous volume **Using OpenMP: Portable Shared Memory Parallel Programming** MIT Press this book goes beyond the fundamentals to focus on what has been

changed and added to OpenMP since the 2.5 specifications. It emphasizes four major and advanced areas: thread affinity, keeping threads close to their data, accelerators, special hardware to speed up certain operations, tasking to parallelize algorithms with a less regular execution flow, and SIMD hardware assisted operations on vectors. As in the earlier volume, the focus is on practical usage with major new features primarily introduced by example. Examples are restricted to C and C++ but are straightforward enough to be understood by Fortran programmers. After a brief recap of OpenMP 2.5, the book reviews enhancements introduced since 2.5. It then discusses in detail tasking, a major functionality enhancement. Non-Uniform Memory Access (NUMA) architectures supported by OpenMP, SIMD or Single Instruction Multiple Data (SIMD) heterogeneous systems, a new parallel programming model to offload computation to accelerators, and the expected further development of OpenMP.

The world according to zebrafish: How neural circuits generate behaviour Gonzalo G. De Polavieja, German Sumbre, 2014-11-07. Understanding how the brain functions is one of the most ambitious current scientific goals. This challenge will only be accomplished by a multidisciplinary approach involving genetics, molecular biology, optics, ethology, neurobiology, and mathematics, and using tractable model systems. The zebrafish larva is a transparent, genetically tractable, small vertebrate, ideal for the combination of state-of-the-art imaging techniques, e.g., two-photon scanning microscopy, single-plane illumination microscopy, spatial light modulator microscopy, and lightfield microscopy, bioluminescence, and optogenetics, to monitor and manipulate neuronal activity from single specific neurons up to the entire brain in an intact behaving organism. Furthermore, the zebrafish model offers a large and increasing collection of mutant and transgenic lines modelling human brain diseases. With these advantages in hand, the zebrafish larva became in the recent years a novel animal model to study neuronal circuits and behaviour, taking us closer than ever before to understanding how the brain controls behaviour.
