## **Microturbines Applications For Distributed Energy Systems:**

Microturbines Claire Soares, 2011-04-08 Small scale gas turbines known as Microturbines represent an exciting new development in gas turbine technology They can run in size from small human scale machines down to micro sized mini machines that can barely be seen by the naked eye They also run a great diversity of fuel types from various types of commercial gases to waste generated gases This new book by industry expert Claire Soares will fully describe the various types of microturbines their applications and their particular requirements for installation maintenance and repair It will explain how a microturbine the size of a refrigerator can power an entire school hospital or small factory which is particularly useful for onsite remote installations The book will also show how microturbines can be paired with one or more fuel cells to form a hybrid energy source or can be teamed with any source of distributed power such as a small hydro turbine or a wind turbine Moreover the reader will learn how microturbines can run on a variety of fuels that are far cruder than those required by most standard gas turbines they can be made to run for instance using gas from a landfill or biomass source The reader will find detailed information on costs specifications and maintenance and repair guidelines Ample references and resources will provide the reader with tools for finding manufacturers and product specifications for their own particular needs Covers major categories of microturbines including factors common to their design installation operation optimization maintenance and repair Invaluable guidance on market factors and economics affecting microturbines and their applications particularly for distributed power generation Provides current case studies showing microturbines used in hybrid systems with fuel cells and other types of power generation systems

**Small-Scale Energy Systems with Gas Turbines and Heat Pumps** Satoru Okamoto, 2021-03-29 A heat pump system can produce an amount of heat energy that is greater than the amount of energy used to run the heat pump system Thus a heat pump system is considered to be a machine system that can use energies efficiently as is the load leveling air conditioning system utilizing unutilized energies at high levels Adaptations of gas turbines for industrial utility and marine propulsion applications have long been accepted as means for generating power with high efficiency and ease of maintenance Cogeneration with gas turbine is frequently defined as the sequential production of useful thermal energy and shaft power from a single energy source For applications that generate electricity the power can either be used internally or supplied to the utility grid This Special Issue intends to provide an overview of the existing knowledge related with various aspects of Small Scale Energy Systems with Gas Turbines and Heat Pumps and contributions on but not limited to the following subjects were encouraged wake of stator vane to improve sealing effectiveness gas turbine cycle with external combustion chamber for prosumer and distributed energy systems computational simulation of gas turbine engine operating with different blends of biodiesel experimental methodology and facility for the engine performance and emissions evaluation using jet and biodiesel blends experimental analysis of an air heat pump for heating service hybrid fuel cell Brayton cycle for combined heat and power design analysis of
