Rajakaruna,Farhad Shahnia,Arindam Ghosh,2014-11-29 This book focuses on the state of the art in worldwide research on applying optimization approaches to intelligently control charging and discharging of batteries of Plug in Electric Vehicles PEVs in smart grids Network constraints cost considerations the number and penetration level of PEVs utilization of PEVs by their owners ancillary services load forecasting risk analysis etc are all different criteria considered by the researchers in developing mathematical based equations which represent the presence of PEVs in electric networks Different objective functions can be defined and different optimization methods can be utilized to coordinate the performance of PEVs in smart grids This book will be an excellent resource for anyone interested in grasping the current state of applying different optimization techniques and approaches that can manage the presence of PEVs in smart grids **Electric Vehicle - Smart Grid Integration: Load Modeling, Scheduling, and Cyber Security** Yu-Wei Chung,2020 The modern world has

witnessed the surge of electric vehicles EVs driven by government policy worldwide to reduce transportation s dependence on fossil fuels According to Slowik 2019 the global EV market has grown sharply with the annual light duty EV sales

surpassing 2 million in 2018 which is about a 70% increase from 2017. The increase in EV population implies the rise in energy demand and that introduces new challenges to the electricity sector. EV charging load demand in high penetration scenarios which is foreseen may lead to stability and quality issues in power grids. Generation capacity and the electricity infrastructure upgrade may be required to address those issues however it increases generation costs significantly. The most common EV chargers installed today deliver around 7 kW of power which is over four times that of an average household power consumption in the US. EV charging load often shows two peaks in a day one in the morning when people plug in the EV at the workplace and the other in the evening when people get home from work. Without proper energy management for EV charging the vast power demand due to a large number of plugged in EVs can stress the electric grid, degrade the electric power quality and impact the wholesale electricity market. Although an EV battery may store energy up to 80 kWh which requires more than 10 hours to charge at 7kW from empty we found that most EVs need only 12 kWh per charge or 1.7 hours at 7 kW to meet daily commute requirement while they stay in the parking garage for a more extended period. This implies that EVs can have considerable time flexibility for charging and it is not necessary to start charging right after plugging in which is likely to result in the charging power add up. A proper EV charging schedule can well allocate the charging load to prevent power peaks. Therefore EV charging scheduling can play a significant role in mitigating the adverse effects of vast EV charging demand without upgrading the power grid capacity. To optimize the EV charging schedule while satisfies EVs charging demand each EV's stay duration and energy need are essential parameters for the optimization. Those parameters are based on predictions to minimize human intervention. Nonetheless the uncertainty of EV user behavior poses a challenge to the prediction accuracy. Therefore this dissertation demonstrates an ensemble machine learning based method to model and predict the EV loads accurately thereby improving the performance of EV charging scheduling. On the other hand this smart EV grid integration which requires massive communication including collecting, transmitting and distributing real time data within the network makes it more susceptible to cyber physical threats. Potential breaches could not only affect grid operation but also reduce consumers' willingness to adopting EVs over conventional fuel powered vehicles. This dissertation also presents the vulnerability analysis and risk assessment for a smart EV charging system to develop the countermeasures to secure the network. Also while it is inevitable that the security has flaws this dissertation provides a novel anomaly detection approach based on the invariant correlations of different measurements within the EV charging network.

Developing Charging Infrastructure and Technologies for Electric Vehicles Alam, Mohammad Saad, Pillai, Reji Kumar, Murugesan, N., 2021-12-31. The increase in air pollution and vehicular emissions has led to the development of the renewable energy based generation and electrification of transportation. Further the electrification shift faces an enormous challenge due to limited driving range, long charging time and high initial cost of deployment. Firstly there has been a discussion on renewable energy such as how wind power and solar power can be generated by wind turbines and

photovoltaics respectively while these are intermittent in nature. The combination of these renewable energy resources with available power generation system will make electric vehicle EV charging sustainable and viable after the payback period. Recently there has also been a significant discussion focused on various EV charging types and the level of power for charging to minimize the charging time. By focusing on both sustainable and renewable energy as well as charging infrastructures and technologies the future for EV can be explored. Developing Charging Infrastructure and Technologies for Electric Vehicles reviews and discusses the state of the art in electric vehicle charging technologies their applications economic environmental and social impact and integration with renewable energy. This book captures the state of the art in electric vehicle charging infrastructure deployment their applications architectures and relevant technologies. In addition this book identifies potential research directions and technologies that facilitate insights on EV charging in various charging places such as smart home charging parking EV charging and charging stations. This book will be essential for power system architects mechanics electrical engineers practitioners developers practitioners researchers academicians and students interested in the problems and solutions to the state of the art status of electric vehicles.
