**Optimum Design of Steel Structures** József Farkas, Károly Jármai, 2013-03-29 This book helps designers and manufacturers to select and develop the most suitable and competitive steel structures which are safe fit for production and economic An optimum design system is used to find the best characteristics of structural models which guarantee the fulfilment of design and fabrication requirements and minimize the cost function Realistic numerical models are used as main components of industrial steel structures Chapter 1 contains some experiences with the optimum design of steel structures Chapter 2 treats some newer mathematical optimization methods Chapter 3 gives formulae for fabrication times and costs Chapter 4 deals with beams and columns Summarizes the Eurocode rules for design Chapter 5 deals with the design of tubular trusses Chapter 6 gives the design of frame structures and fire resistant design rules for a frame In Chapters 7 some minimum cost design problems of stiffened and cellular plates and shells are worked out for cases of different stiffenings and loads Chapter 8 gives a cost comparison of cylindrical and conical shells The book contains a large collection of literatures and a subject list and a name index *High Performance and Optimum Design of Structures and Materials V S.*

Hernandez, G. Schleyer, 2022-09-13 The use of novel materials and new structural concepts nowadays is not restricted to highly technical areas like aerospace aeronautical applications or the automotive industry but affects all engineering fields including those such as civil engineering and architecture The included contributions highlight the latest developments in design and manufacturing Most high performance structures require the development of a generation of new materials which can more easily resist a range of external stimuli or react in a non conventional manner Particular emphasis is placed on intelligent structures and materials as well as the application of computational methods for their modelling control and management The book also addresses the topic of design optimisation Contributions cover numerical methods different optimisation techniques and new software Optimisation problems include those related to the size shape and topology of structures and materials Optimisation techniques have much to offer to those involved in the design of new industrial products as the appearance of powerful commercial computer codes has created a fertile field for the incorporation of optimisation in the design process of all engineering disciplines The performance of structures under shock and impact loads is another area covered The increasing need to protect civilian infrastructure and industrial facilities against unintentional loads arising from accidental impact and explosion events as well as terrorist attacks is reflected in the sustained interest worldwide While advances have been made in recent decades many challenges remain such as developing more effective and efficient blast and impact mitigation approaches or assessing the uncertainties associated with large and small scale testing and validation of numerical and analytical models The overall aim is to move towards a better understanding of the critical issues relating to the testing behaviour modelling and analyses of protective structures against blast and impact loading The studies contained in this volume were presented at the International Conference on High Performance and Optimum

Structures and Materials Encompassing Shock and Impact Loading and address issues involving advanced types of structures particularly those based on new concepts and shock and impact resistance High Performance and Optimum Design of Structures and Materials W. P. De Wilde, S. Hernández, C. A. Hernández, W.P. De Wilde, M. Sejnoha, 2020-11-18 Most high performance structures require the development of a generation of new materials which can more easily resist a range of external stimuli or react in a non conventional manner Formed of research works presented at the 10th International Conference on High Performance and Optimum Design of Structures and Materials the included papers cover issues involving advanced types of structures particularly those based on new concepts or new materials and their system design Contributions highlight the latest developments in design optimisation manufacturing and experimentation There is also a focus on the search for higher performance sustainable materials Particular emphasis is placed on intelligent structures and materials as well as the

application of computational methods for their modelling control and management Optimisation problems are also covered including those related to the size shape and topology of structures and materials Optimisation techniques have much to offer to those involved in the design of new industrial products The development of new algorithms and the appearance of powerful commercial computer codes with easy to use graphical interfaces has created a fertile field for the incorporation of optimisation in the design process in all engineering disciplines

**Optimum Design of Steel Structures Using Evolutionary Algorithms** Zolisa Dolwana,2019 *Analysis and Optimum Design of Metal Structures* J Farkas,K.

Jármai,2020-12-18 Detailing a number of structural analysis problems such as residual welding stresses and distortions and behaviour of thin walled rods loaded in bending this text also explores mathematical function minimization methods expert systems and optimum design of welded box beams

**Music-Inspired Harmony Search Algorithm** Zong Woo Geem,2009-05-12 Calculus has been used in solving many scientific and engineering problems For optimization problems however the differential calculus technique sometimes has a drawback when the objective function is step wise discontinuous or multi modal or when decision variables are discrete rather than continuous Thus researchers have recently turned their interests into metaheuristic algorithms that have been inspired by natural phenomena such as evolution animal behavior or metallic annealing This book especially focuses on a music inspired metaheuristic algorithm harmony search Interestingly there exists an analogy between music and optimization each musical instrument corresponds to each decision variable musical note corresponds to variable value and harmony corresponds to solution vector Just like musicians in Jazz improvisation play notes randomly or based on experiences in order to find fantastic harmony variables in the harmony search algorithm have random values or previously memorized good values in order to find optimal solution

**Meta-heuristic Algorithms for Optimal Design of Real-Size Structures** Ali Kaveh,Majid Ilchi Ghazaan,2018-04-10 The contributions in this book discuss large scale problems like the optimal design of domes antennas transmission line towers barrel vaults and steel frames with different types of limitations such as strength buckling displacement and natural frequencies The authors use a set of definite algorithms for the optimization of all types of structures They also add a new enhanced version of VPS and information about configuration processes to all chapters Domes are of special interest to engineers as they enclose a maximum amount of space with a minimum surface and have proven to be very economical in terms of consumption of constructional materials Antennas and transmission line towers are the one of the most popular structure since these steel lattice towers are inexpensive strong light and wind resistant Architects and engineers choose barrel vaults as viable and often highly suitable forms for covering not only low cost industrial buildings warehouses large span hangars indoor sports stadiums but also large cultural and leisure centers Steel buildings are preferred in residential as well as commercial buildings due to their high strength and ductility particularly in regions which are prone to earthquakes
