Integrated Vector Management

G. A. Matthews,2011-08-17 Diseases transmitted by insects continue to have a major impact on human populations Malaria dengue onchocerciasis sleeping sickness and leishmaniasis all adversely affect man Malaria is one of the most important causes of child mortality and reduces economic development in many countries with agricultural productivity often greatly reduced as many vectors are active in the wet season favourable for crop production Vector control is crucial to reduce the extent to which drugs are needed to treat the diseases as the parasite can become resistant or the drugs are often too expensive for those living in rural areas and urban slums most affected by these diseases Chemical control of vectors is often the only method that can reduce vector populations in a disease epidemic but with vectors developing resistance to insecticides there is increasing awareness that a single control method is often insufficient and also that chemical control must be integrated where possible with other control measures In Integrated Vector Management Graham Matthews covers

the main chemical methods of vector control including the use of indoor residual spraying space treatments the use of treated bed nets and larviciding but also stresses the importance of drainage schemes and improvement of houses to prevent access of indoor vectors techniques that have largely been responsible for reducing the risk of vector borne diseases in Europe and the USA This book combines practical information from successful vector control programmes including early use of DDT and recent research into a vital resource for all those now involved in combating insect vector borne diseases Integrated Vector Management is an essential tool not only for medical entomologists and those directly involved in government health departments but also for all those who provide the skills and management needed to operate successful area wide vector management programmes Libraries in all universities and research establishments world wide where biological sciences medicine and agriculture are studied and taught should have multiple copies of this important book

Vector Control Jan A. Rozendaal, 1997 The first comprehensive illustrated guide to vector control methods suitable for use by individuals and communities Published at a time when large scale control programs organized by governments are declining the manual aims to help non professionals understand the role of vectors in specific diseases and then select and use control methods that are appropriate effective affordable and safe Hundreds of simple inexpensive and often ingenious techniques developed and used in a host of different settings are presented and described in this abundantly illustrated guide The manual is intended to assist health workers at district and community level in aid organizations in refugee camps or in resource development projects who do not have direct access to experts in entomology yet need methods for controlling the vectors of such important diseases as malaria filariasis leishmaniasis schistosomiasis dengue and trypanosomiasis With this audience in mind the book combines non specialist factual information about vectors and the diseases they cause with practical advice on control measures whether involving the use of insecticides environmental modifications or the construction of simple devices from local materials Details range from a table showing where and when the different groups of biting Diptera are active to a recipe for preparing plaster to protect homes against triatomine bugs from step by step instructions for the construction of cheap insect traps to advice on how to impregnate bed nets and curtains with suitable insecticides The book opens with a brief description of recent changes in the approach to vector control followed by a discussion of factors that can influence the success of control measures undertaken by individuals and communities The core of the manual consists of eight chapters focused on each of the major vectors and groups of vectors mosquitos and other biting Diptera tsetse flies triatomine bugs bedbugs fleas lice ticks and mites cockroaches houseflies cyclops and freshwater snails Each chapter includes pertinent facts about the vector's life cycle behavior and favorite habitats the diseases it causes and their clinical features including opportunities for prevention treatment and control Against this background methods for control are presented in great detail Since the use of control measures is often constrained by lack of resources as well as lack of knowledge most methods described are simple and cheap do not require much training or supervision and are safe for

both the user and the environment The remaining chapters offer guidance on the principles and practice of house spraying with residual insecticides and provide instructions for the safe use of pesticides and the emergency treatment of poisoning
