Observational Gait Analysis:

Observational Gait Analysis Janet Adams,Kay Cerny,2024-06-01 Observational Gait Analysis A Visual Guide is a pedagogical manual and video library that provides a thorough review of key characteristics of normal gait that are important for observational clinical gait analysis This visual guide by Drs Jan Adams and Kay Cerny has unique features to further the understanding of examination and evaluation of the subject s gait such as Normal and pathological gait are described using figures and graphs along with gait videos and 3D graphs to show the kinematics and kinetics described Functional tools used as outcome measures to evaluate gait performance in the community environment including Dynamic Gait Test Six Minute Walk Test Ten Meter Walk Test to name a few In addition to the unique features the pathological gait section presents descriptions of gait deviations included in a new clinical Observational Gait Analysis OGA tool along with probable causes for each of the deviations Case studies are presented using this new tool for examining and evaluating the subject s gait Bonus Students will be able to watch antero posterior and lateral videos of individuals with gait deviations complete the OGA tool to document their gait examination and evaluate their examination results They will then validate their observational skills by comparing their results to the text s case study OGA results and the skeletal model and motion and moment graphs completed by 3D instrumented analysis of the same individual The student will then compare their evaluation of causes of deviations to that included in the case study Included with the text are online supplemental materials for faculty use in the classroom Observational Gait Analysis A Visual Guide will be the go to resource for clinical tools to analyze gait for physical therapy and prosthetic and orthotic students and clinicians as well as other professionals interested in the clinical analysis of persons with gait disability

Observational Gait Analysis Rancho Los Amigos National Rehabilitation Center,2001-01-01 Observational Gait Analysis is written to assist physical therapists and physicians to effectively evaluate pathological gait It presents a method of gait analysis which can easily be applied in the clinic The first edition Normal and Pathological Gait Syllabus was published in 1981 In 1989 the Observational Gait Analysis Handbook was published The third edition contains changes in the normal joint ranges of motion as a result of more sophisticated and accurate equipment Muscle actively has been revised to reflect data from a larger sample size The phases and functional tasks are defined and a problem solving approach to observational gait analysis is presented

McGough,2003 **The Development and Assessment of a Teaching Approach to Observational Gait Analysis** Mary Katie Gillis,1977 **Development and Reliability of an Observational Gait Analysis Tool for Children with Down Syndrome** Erin Wagoner,Teresa Wingler,Tara Evans,Jamie Huffman,Julie Beuligmann,2008 **Reliability of the Ranchos Los Amigos Observational Gait Analysis Form** Carol Daukas,Kimberly Gould,1991* Abstract Observational gait analysis is a skill that is frequently used in

physical therapy but it is a skill that is difficult to objectify The Ranchos Los Amigos Observational Gait Analysis Form RLAOGAF attempts to do this The purposes of this study were to examine 1 The interrater reliability of the RLAOGAF between acute care outpatient and rehab therapists when evaluating a videotaped patient and 2 the validity of the RLAOGAF The fifty therapists who participated had less than five years of clinical practice and received a one hour instructional inservice on the RLAOGAF A two way chi square detected interrater reliability between the two groups A one way chi square was then done which detected strong reliability for the RLAOGAF with therapists overall in agreement that deviations did not exist Validity was determined using a one way chi square comparing the therapists answers to the Newington Gait Lab Analysis Validity was found to be poor for the three subphases tested It was determined that the therapists were reliable when using this form but the deviations tested were not valid Gait analysis is an integral part of the physical therapy evaluation Many therapists utilize gait analysis as an aid in diagnosing the patient's problem's to assign an assistive walking device and to develop a plan of treatment Objective measures of analyzing gait are necessary for documenting progress The problem clinicians are faced with is that instrumented measures of objectively quantifying gait are expensive and time consuming and therefore are not practical in a clinical setting As a result clinics tend to rely on observational methods of analyzing gait This is quick and inexpensive but requires the physical therapist to simultaneously observe all the joints involved in the gait cycle In order to do this the therapist must have an excellent knowledge of exactly what is supposed to occur at each joint with regard for joint angles and muscle involvement throughout the gait cycle There are many phases to the gait cycle and many joints are involved so it is often difficult for a therapist to note everything that occurs in a single gait cycle In addition if the therapist has a patient walk a runway several times so that every component of the gait cycle can be observed carefully the patient may fatigue therefore the therapist will not have an accurate and clear picture of what is truly occurring

Use of the Isolated Elements Effect to Teach Observational Gait Analysis Kelly J. Sass, 2016 In the isolated elements group the learners received the content in several separate videos that isolated each of the sub phases of gait prior to viewing a summary video that included all of the interacting gait cycle components Learners in the interacting elements group received the content in one video that included the full gait cycle followed by the same summary video Students in the isolated elements groups reported lower mental effort ratings immediately after viewing the isolated elements videos than did the interacting group after viewing the single video tutorial However there was no differences in either mental effort or task difficulty ratings at the other time points during the lesson or during the assessments Performance scores and confidence ratings did not differ between the two groups Within group analyses found that there were significant changes over time in both groups for mental effort performance scores and confidence ratings A statistically significant change was noted over time for task difficulty in the interacting elements group The reduction in mental effort ratings immediately following the tutorial content for the isolated elements group lends support the theory that isolating the individual elements

prior to teaching the complex interactions can reduce cognitive load for learners. However this reduction in cognitive load did not translate into improved test scores or confidence compared to the interacting elements group. Future research is needed to identify instructional methods that can further reduce the cognitive load and increase the learning outcomes of students learning observational gait analysis. In addition alternative objective methods of assessing cognitive load should be explored.

Kannenberg,Shane Wurdeman,Ruediger Rupp ,Laurent Frossard,2024-08-20 According to a 2005 report of the World Health Organization WHO an estimated 1.3 billion people worldwide 16% of the global population experienced significant disability. This number has only been increasing due to population ageing and an increase in the prevalence of non-communicable diseases. Rehabilitation addresses the impact of a health condition on a person's everyday life by optimizing their function and reducing the experience of disability. Rehabilitation ensures people with a health condition can remain as independent as possible and participate in education, work and meaningful life roles. Global demographic and health trends such as population ageing, medical staffing shortages, rising prevalence of non-communicable diseases, as well as continued consequences of conflict, injury and developmental conditions are placing increasing demands on the health care systems. The need for quality rehabilitation is rapidly growing, yet in many parts of the world this need is largely unmet.
