

What is Marine Biology?

Marine biology is the study of life in the ocean. This huge body of saltwater covers about two-thirds of our planet's surface and contains many different marine ecosystems. Life within it is more diverse than life on land!

Corals reefs are giant ecosystems built by thousands of tiny organisms called coral polyps. The outside of a coral reef is alive, while the inside is made up of the skeletons of dead coral. They are found in shallow water. The algae that live with them need the sunlight for photosynthesis.

Mangroves can withstand saltwater. They mangrove trees a edge. It's roots hundreds of other creatures.

Life in the Ocean

Sea creatures have special adaptations which allow them to live underwater.

The flounder is a fish that can disguise itself to mimic its surroundings. Its ability to camouflage helps it to survive.

Humans get oxygen through their lungs. Fish breathe through their gills.

Sea turtles have flippers to swim quickly through the water.

An octopus can change color and shape to match its surroundings.

Humans breathe air through their lungs.
