Numerical and experimental investigations of distribution of gaseous emissions with the air flow in the indoor environment Umer Afzal, 2017 There are many

sources of emissions produced by burning fuel for power or heat through chemical reactions and from leaks from industrial processes or equipment. There is always a possibility of a potential hazard when these gases enter into the indoor environment with the air flow. The determination of the concentration profiles are necessary to evaluate the potential hazard posed by the gas spread. The main objectives of this work are to develop an appropriate measurement methodology and a 3D CFD transient multicomponent simulation model for the determination of spatial and temporal distribution of gaseous emissions with the air flow in the indoor environment. This work is also aimed at comparing the numerical simulation results of different CFD programs for a 2D base case model of indoor air flow with and without emission source under laminar and turbulent flow conditions for the purpose of developing a better basic understanding of the physical phenomena and for the selection of the suitable and appropriate CFD program for the further development of the simulation model. One of the goals is also to apply the developed simulation model to the loss prevention and risk mitigation in the indoor environment and to study the influence of different parameters on the concentration distribution of gaseous pollutants in the presence of air flow in the indoor environment to minimize the expensive and time consuming experimentation efforts.

Proceedings of the 15th International Symposium on Experimental and Computational Aerothermodynamics of Internal Flows G. Rajesh, A. Sameen, C. Anbu Serene Raj, 2025-06-27. This book is a carefully curated collection of technical research papers presented at the 15th International Symposium on Experimental and Computational Aerothermodynamics of Internal Flows ISAIF 15. It highlights the latest advancements in experimental and computational studies of internal flows covering diverse and cutting edge topics. The proceedings feature significant research on shock wave boundary layer interactions, aeroacoustics of supersonic jets and the dynamics of pulsatile fluid flows. Studies on multiphase flows, biofluid dynamics and heat transfer with hydrophobic coatings underscore the interdisciplinary nature of the work. Advanced numerical simulations including models of biomagnetic flows, red blood cell migration and ejector diffuser systems in high altitude testing are also showcased. Practical applications such as improving aerodynamic efficiency for high speed trains, mitigating shock wave effects and enhancing supersonic ejector performance are explored alongside theoretical advancements. This ensures a balanced perspective on the challenges and opportunities in aerothermodynamics. Aimed at academics, researchers and industry professionals, this book bridges theoretical principles with real world applications. Each chapter reflects rigorous scientific inquiry offering insights into innovative methodologies, computational models and practical solutions. It serves as a definitive resource for those seeking to understand and advance the state of the art in fluid dynamics and aerospace engineering. Whether you are delving into flow control, heat transfer or the intricacies of combustion dynamics, this book provides a comprehensive repository of knowledge inspiring future research and fostering innovation in the field of aerothermodynamics.

Wind Turbine Aerodynamics Wen Zhong Shen, 2019-10-04. Wind turbine aerodynamics is one of the central subjects of wind turbine technology. To reduce the levelized cost of energy (LCOE), the size of a single wind turbine has

been increased to 12 MW at present with further increases expected in the near future Big wind turbines and their associated wind farms have many advantages but also challenges The typical effects are mainly related to the increase in Reynolds number and blade flexibility This Special Issue is a collection of 21 important research works addressing the aerodynamic challenges appearing in such developments The 21 research papers cover a wide range of problems related to wind turbine aerodynamics which includes atmospheric turbulent flow modeling wind turbine flow modeling wind turbine design wind turbine control wind farm flow modeling in complex terrain wind turbine noise modeling vertical axis wind turbine and offshore wind energy Readers from all over the globe are expected to greatly benefit from this Special Issue collection regarding their own work and the goal of enabling the technological development of new environmentally friendly and cost effective wind energy systems in order to reach the target of 100% energy use from renewable sources worldwide by 2050
