Optimization Strategies Different Aerodynamic Compressor:

Optimization and Coupling Strategies for Codes of Different Fidelity to Automate an Aerodynamic Compressor Design Process Fiete Pöhlmann, 2015 **Aerothermodynamics of Turbomachinery** Naixing Chen, 2011-09-23

Computational Fluid Dynamics CFD is now an essential and effective tool used in the design of all types of turbomachine and this topic constitutes the main theme of this book. With over 50 years of experience in the field of aerodynamics, Professor Naixing Chen has developed a wide range of numerical methods covering almost the entire spectrum of turbomachinery applications. Moreover, he has also made significant contributions to practical experiments and real-life designs. The book focuses on rigorous mathematical derivation of the equations governing flow and detailed descriptions of the numerical methods used to solve the equations. Numerous applications of the methods to different types of turbomachine are given, and in many cases, the numerical results are compared to experimental measurements. These comparisons illustrate the strengths and weaknesses of the methods, a useful guide for readers. Lessons for the design of improved blading are also indicated after many applications. Presents a real-world perspective to the past, present, and future concerns in turbomachinery. Covers direct and inverse solutions with theoretical and practical aspects. Demonstrates huge application background in China. Supplementary instructional materials are available on the companion website *Aerothermodynamics of Turbomachinery Analysis and Design*, ideal for senior undergraduates and graduates studying in the fields of mechanics, energy, and power, and aerospace engineering design engineers in the business of manufacturing compressors, steam, and gas turbines, and research engineers and scientists working in the areas of fluid mechanics, aerodynamics, and heat transfer. Supplementary lecture materials for instructors are available at www.wiley.com/go/chenturbo. *11th International Conference on Turbochargers and Turbocharging* IMechE, 2014-08-25. The future market forces and environmental considerations in the passenger car and commercial vehicle sector mean more stringent engine downsizing is far more prevalent. Therefore, novel systems are required to provide boosting solutions, including hybrid electric motor and exhaust waste energy recovery systems, for high efficiency, response, reliability, durability, and compactness. The current emission legislations and environmental trends for reducing CO₂ and fuel consumption are the major market forces in the land and marine transport industries. The internal combustion engine is the key product, and downsizing, efficiency, and economy are the driving forces for development for both spark ignition (SI) and compression ignition (CI) engines in both markets. Future market forces and environmental considerations for transportation, specifically in the passenger car, commercial vehicle, and the marine sectors, mean more stringent engine downsizing. This international conference is the latest in the highly successful and prestigious series held regularly since 1978. These proceedings from the Institution's highly successful and prestigious series address current and novel aspects of turbocharging systems, design, boosting solutions for engine downsizing, and improvements in efficiency, and present the latest research and development in this growing and innovative area. Focuses on boosting solutions.

including hybrid electric motor and exhaust waste energy recovery systems Explores the current need for high efficiency reliability durability and compactness in recovery systems Examines what new systems developments are underway
