Rendering UML Class Diagrams to Support Layout Design Paul Joseph Leyden, 2019 This thesis investigates and implements mechanisms to render and layout software design models that are reverse engineered from software systems The software design models are represented as Unified Modeling Language UML class diagrams UML diagrams are widely used by software developers to document the design of software systems The work presented here extends a software system srcUML that takes source code as input and generates a graphical picture of the UML class diagram The system is built on top of the srcML infrastructure This infrastructure parses the source code and provides access to the abstract syntax for the analysis necessary to generate

the UML class diagram The main contribution of the work presented is extending the system to support various layout algorithms for the class diagrams The extension allows users to provide their own customized layout algorithms to the system This directly supports research in software comprehension by allowing comparison between different layout algorithms No current UML rendering tools allow different custom layout algorithms to be used The system is open source and available at [www srcML org](http://www.srcML.org)
