Numerical Methods for Chemical Engineers with MATLAB Applications A. Constantinides, Navid Mostoufi, 1999 Master numerical methods using MATLAB today's leading software for problem solving. This complete guide to numerical methods in chemical

engineering is the first to take full advantage of MATLAB's powerful calculation environment. Every chapter contains several examples using general MATLAB functions that implement the method and can also be applied to many other problems in the same category. The authors begin by introducing the solution of nonlinear equations using several standard approaches including methods of successive substitution and linear interpolation, the Wegstein method, the Newton Raphson method, the Eigenvalue method, and synthetic division algorithms. With these fundamentals in hand, they move on to simultaneous linear algebraic equations, covering matrix and vector operations, Cramer's rule, Gauss methods, the Jacobi method, and the characteristic value problem. Additional coverage includes Finite difference methods and interpolation of equally and unequally spaced points, Numerical differentiation and integration, including differentiation by backward, forward, and central finite differences, Newton Cotes formulas, and the Gauss Quadrature. Two detailed chapters on ordinary and partial differential equations, Linear and nonlinear regression analyses, including least squares, estimated vector of parameters, method of steepest descent, Gauss Newton method, Marquardt Method, Newton Method, and multiple nonlinear regression. The numerical methods covered here represent virtually all of those commonly used by practicing chemical engineers. The focus on MATLAB enables readers to accomplish more with less complexity than was possible with traditional FORTRAN. For those unfamiliar with MATLAB, a brief introduction is provided as an Appendix. Over 60 MATLAB examples, methods, and function scripts are covered and all of them are included on the book's CD.

An Introduction to Numerical Methods Abdelwahab Kharab, Ronald B. Guenther, 2011-11-16 Highly recommended by CHOICE previous editions of this popular textbook offered an accessible and practical introduction to numerical analysis. An Introduction to Numerical Methods: A MATLAB Approach

Third Edition continues to present a wide range of useful and important algorithms for scientific and engineering applications. The authors use MATLAB to illustrate each numerical method providing full details of the computer results so that the main steps are easily visualized and interpreted. New to the Third Edition: A chapter on the numerical solution of integral equations; A section on nonlinear partial differential equations (PDEs) in the last chapter; Inclusion of MATLAB GUIs throughout the text. The book begins with simple theoretical and computational topics including computer floating point arithmetic, errors, interval arithmetic, and the root of equations. After presenting direct and iterative methods for solving systems of linear equations, the authors discuss interpolation, spline functions, concepts of least squares, data fitting, and numerical optimization. They then focus on numerical differentiation and efficient integration techniques as well as a variety of numerical techniques for solving linear integral equations, ordinary differential equations, and boundary value problems. The book concludes with numerical techniques for computing the eigenvalues and eigenvectors of a matrix and for solving PDEs. CD ROM Resource: The accompanying CD ROM contains simple MATLAB functions that help students understand how the methods work. These functions provide a clear step by step explanation of the mechanism behind the algorithm of each numerical method and guide students through the calculations necessary to understand the algorithm. Written in an easy to follow, simple style, this text improves students' ability to master the theoretical and practical elements of the methods. Through this book they will be able to solve many numerical problems using MATLAB.
