Murray-Smith, 2012-12-06 obtained by simulation more quickly effect Computer simulation of dynamic systems is a topic which is growing steadily in importance and cheaply than by experimentation and testing of the real system. System performance in the physical sciences, engineering, biology, and medicine. The reasons for this trend can also be investigated using simulation, not only to the steadily increasing demand for a much wider range of conditions than can be contemplated for the real system, power of computers and the rapidly falling costs of hardware but also to the availability because of operating constraints or safety of appropriate software tools in the form of requirements. Similar factors can apply in simulation languages. Problem oriented languages in other fields such as biomedical systems languages of this kind assist those who are not engineering specialists in computational methods to transform system simulation using digital computers can relate either to models based on continuous mathematical description into a simulation program in a simple and straightforward manner using variables or to discrete event descriptions. They can also provide useful diagnosis. Continuous system simulation techniques are applied to systems described by sets of differential information when difficulties are encountered. Therefore a simulation language contains equations and algebraic equations. Subject Guide to Books
