Ferrante, C. A. Brebbia, 1996 In recent years it has become increasingly important to study the behaviour of coastal areas and to be able to model such regions under normal and extreme conditions The poor environmental quality in these regions due to pollution and other problems has been the cause of serious international concern with many of the worst affected areas being densely populated or the sites of major industrial development Computer models in combination with sensing equipment and experimental sampling techniques have helped in the prevention of natural and man made disasters by providing adequate means for the study of the behaviour of water ground and air systems Computer models are also used for the determination and assessment of a situation once a disaster has occurred thus aiding the optimization of the resources available from remedial action However it is clear that further study into environmental problems using efficient and reliable modelling and analysis tools is essential in order to maintain and improve on existing methods This book will be of particular interest to people involved in
