A. Brebbia,L. Traversoni,Luiz C. Wrobel,1995 The importance of accurately modelling seas and coastal regions is emphasized by the need for a better understanding of their normal behaviour and response to extreme conditions Problems such as pollution of these areas have become a major international concern and the related environmental consequences need further study in order that proper remedial actions can be designed Computer models are an efficient tool to determine the response of water systems in combination with remote sensing and experimental sampling Furthermore once a disaster occurs models can be used to determine its extent and impact and aid the optimization of the use of available resources This book contains the papers presented at the Second International Conference on Computer Modelling of Seas and Coastal Regions held in Cancun Mexico in September 1995 The conference attracted contributions from many different countries covering a multitude of topics and techniques in the areas of shallow water models pollutant transport and dispersion wave propagation coastal erosion littoral drift tidal simulation storm surges estuaries and coastal lakes and lagoons **BOOK JACKET** Title Summary field provided by Blackwell North America Inc All Rights Reserved **Environmentally Friendly Coastal Protection** Claus Zimmermann,Robert G. C. Fernando,1996 **Evaluation of Numerical Models for a Floating Breakwater** Kozo Bando,Choule J. Sonu,1987 A large number of existing state of the art numerical models were reviewed for the purpose of selecting an efficient model to be used for routine analysis of wave attenuation and mooring forces associated with a floating breakwater The models reviewed came from five basic categories Eigen Function Expansion Models Green Function Models Hybrid Green Function Models Finite Element Models and other models The critical parameters in the selection process were a computational efficiency b ability to accommodate three dimensional spectra as the input wave and c versatility relative to breakwater geometry and water depths Based on these criteria a Hybrid Green Function Model was selected as the optimum numerical model followed by a Green Function Model Recommendations are presented which include the acquisition and adaptation of the selected model and the comparison of output with corresponding prototype data The two dimensional model also was recommended for use as a fast diagnostic assessment tool During test runs investigators should pay special attention to the development of optimum procedures for determining the mooring force Results of prototype tests performed

Morphodynamic Model for Predicting Beach Changes Based on Bagnold's Concept and Its Applications

Takaaki Uda, 2018-12-19 The authors have developed models for predicting beach changes applicable to various problems on real coasts One of them is the contour line change model to predict long term beach changes caused by the imbalance in longshore sand transport which is a kind of N line model Because the calculation of the nearshore current is not needed in this model and the computational load is small it has an advantage in the prediction of long term topographic changes on an extensive coast However the handling of boundary conditions becomes difficult when offshore coastal structures are constructed in a complicated manner and in this regard the so called 3D model has an advantage Taking this point into account the authors developed a morphodynamic model BG model by applying the concept of the equilibrium slope and the energetics approach in which depth changes on 2D horizontal grids are calculated

Physical and Numerical Modelling of Wave Interaction with a Three-dimensional Submerged Structure

Scott Baker, 2008 Submerged structures are frequently used in coastal engineering applications such as tunnel and pipeline protection works breakwaters and artificial reefs Although a significant number of research works have focused on low crested structures there is far less research into deeply submerged structures In most research lightly sloped uniform cross sectioned submerged structures with specific crest elevations are considered The present thesis deals with the three dimensional physical and numerical modelling of the interaction of irregular waves with a large scale three dimensional submerged structure It aims to advance the understanding of the structure s influence on the irregular wave field the wave induced velocities along the structure crest and the wave induced currents The ability of a nonlinear Boussinesq wave model to simulate these processes is also investigated and assessed Analysis was performed on a multitude of data including but not limited to wave heights wave periods wave energy spectra energy transfer functions reflection analyses and wave induced velocities In general the analysis and comparison performed showed that the numerical model provided a modestly accurate representation of the physical modelling results

Numerical Modeling of Water Waves

Pengzhi Lin, 2008-04-30 Modelling large scale wave fields and their interaction with coastal and offshore structures has become much more feasible over the last two decades with increases in computer speeds Wave modelling can be viewed as an extension of wave theory a mature and widely published field applied to practical engineering through the use of computer tools

Dynamics of the Coastal Zone

Matteo Postacchini, Alessandro Romano, 2020-03-19 The coastal zone is the host to many human activities which have significantly increased in the last decades However sea level rise and more frequent storm events severely affect beaches and coastal structures with negative consequences and dramatic impacts on coastal communities These aspects add to typical coastal problems like flooding and beach erosion which already leading to large economic losses and human fatalities Modeling is thus fundamental for an exhaustive understanding of the nearshore region in the present and future environment

Innovative tools and technologies may help to better understand coastal processes in terms of hydrodynamics sediment transport bed morphology and their interaction with coastal structures This book collects several contributions focusing on nearshore dynamics and span among several time and spatial scales using both physical and numerical approaches The aim is to describe the most recent advances in coastal dynamics **Numerical Modeling of Water Waves** Pengzhi

Lin, 2008-04-30 Modelling large scale wave fields and their interaction with coastal and offshore structures has become much more feasible over the last two decades with increases in computer speeds Wave modelling can be viewed as an extension of wave theory a mature and widely published field applied to practical engineering through the use of computer tools Information about the various wave models which have been developed is often widely scattered in the literature and consequently this is one of the first books devoted to wave models and their applications At the core of the book is an introduction to various types of wave models For each model the theoretical assumptions the application range and the advantages and limitations are elaborated The combined use of different wave models from large scale to local scale is highlighted with a detailed discussion of the application and matching of boundary conditions At the same time the book provides a grounding in hydrodynamics wave theory and numerical methods which underlie wave modelling It presents the theoretical background and also shows how to use these models for achieving different engineering tasks illustrated and reinforced with case study examples
